

We have completed the implementation part of our project (i.e. the coding portion of the project is completed). In particular, we've mined author and title patterns using FP-Close and CloSpan respectively and implemented redundancy removal using one-pass microclustering, extracting strongest context indicators / representative transactions / semantically similar patterns, and used these to reproduce the DBLP experiment.

We may need to touch up some documentation, and we need to record the tutorial presentation. Aside from potential technical issues with recording the tutorial (which would most likely be minor), we do not anticipate any challenges at this time.
